

A Game Master's Guide to Chemical Interactions

Welcome to the world of Chemical Interactions!

This is a roleplaying game where every player experiences storytelling through an immersive world of robots and scorched earth.

Chemical Interactions takes place in an earth thousands of years after humanity's destruction. The world has sunken deep below the surface where remaining societies live in tunnels. The new world is populated by mutated monstrosities and decaying androids. Above ground is an ocean of corrosive gas, waiting for something to get too curious and surface to a melting embrace.

In this game, you and your friends take control of robot bodies and navigate simple and complex encounters with creativity, blunt force, and problem-solving. This is a game of make-believe where anything is possible... within the loose bounds of this guide.

Chapter 1 - How to Play

When you decide to play Chemical Interactions, you are no longer human. Instead, you take on the mantle of an AI piloting a robot through unknown tunnels: a forgotten relic, a leftover servant, or perhaps an intentional project from thousands of years dead doomsday engineers. You along with a group of friends will pilot these champions in a daring game of make-believe where you'll travel through ruined lands and sunken cities. The only limit to your adventures is your imagination and ingenuity.

Getting started

Get a group of friends and choose someone to be the Game Master. This guide is for the Game Master (GM) to learn the rules of the game as well as read about the various creatures and environments they'll have to play with.

If you're still reading this, you have probably been chosen to be the Game Master. Congratulations! If you're a player, this book isn't for you. Stop reading now or risk spoiling the adventure for yourself! Don't be that one kid on Christmas looking to peak at their presents early. You'll just spoil your own fun. Are you still here? Great! Let's get started.

Don't worry about memorizing everything while you read. When in doubt, you can always look back at a chapter. As long as you know the basics and have a general idea of the rest, you'll be fine. The players will start by creating characters using The Player's Guide. They will select from the provided AIs and Vessels, and build out the details from there. As the GM, they might ask you for advice or custom

items, so you'll want to look over the Character Creation sections of the Player's Guide to get an idea.

You'll also want to briefly review their characters after they're created to gain a general idea of their abilities and backstories. You can even talk to the players and work their character's backstory into the adventure's plot. Speaking of which, you'll have to choose an adventure. When in doubt, a pre-made adventure will be provided in The Spelunker's Guide. You will be able to make any changes you want, but for simplicity, it is advised to stick to the general plot.

Structure

Using The Spelunker's Guide (or a world of the GM's own creation), the GM will present an adventure to the players. This involves describing the environment around them, controlling the NPCs and narrating their actions, and narrating the results of the player's actions. Each player will control a character and make decisions on what to do based on the GM's descriptions of the situation.

The GM will set the stage by telling the players where they are, who they are, and what they know. After this, the players will make choices on how to proceed, and the GM must adapt and change the story to follow their decisions.

Six Stats

The six stats are a one-word description of the players, NPCs, and monster's capabilities. They will be used to perform actions, use objects, or complete specific tasks.

- **Strength (STR):** Affects melee attack rolls & damage
 - **Construction (CON):** Analogous to health, used in crafting
 - **Interface (INF):** Affects ranged attack rolls, used for technology
 - **Processing (PRO):** Analogous to sight, affects how much and what information can be gathered from a source
 - **Intelligence (INT):** Affects efficiency and ability to refine chemicals, affects how processed information is used
 - **Dexterity (DEX):** Affects character speed & maneuverability
 - *Every 2 Levels, Choose a Stat to Increase by +1*
-

Dice and Challenges

In order to perform an action or complete an ability check, you'll need to roll for an outcome.

- GM decides a fail threshold/percentage (ex. 60% failure). Guidelines are provided for different checks.
- Players roll 2d10, with the first die rolled as the tens digit and the second die rolled as the singles digit

- If a player rolls a 5 and a 3, their total roll would be 53
 - To succeed, players need to roll higher than the fail percentage (ex. need to roll 61 or greater to beat a 60% failure)
 - Bonuses:
 - For a skill challenge, take that skill's stat type, multiply it by 5, and add to the roll
 - Ex. Biochemistry is challenged, multiply the player's intelligence modifier by 5, so if it was -1, subtract 5 from the roll. You rolled a 34, which is now 29. The failure rate was 50%, so you failed the ability check.
 - If the player has a skill point in that skill, they may reroll both dice
 - Ex. Biochemistry is challenged, if the player fails their first roll, they may reroll as many times as they have points in that skill. Do you have a +2 skill in biochemistry? You get to roll a total of 3 times and take the best role.
-

Ability Checks

These are actions that take some level of effort to complete. They are attached to one of the six stats. Want to repair a broken generator? Challenge Engineering. Want to distill neurosludge into usable chemicals? Challenge Biochemistry. Want to jump over a ravine? Challenge Dexterity.

Skills

Skills can be thought of as an extension of stats. Where stats are broad, skills are more specified and have a different effect in the game.

Skills can be Influenced by finding skill chips in the world. Skills chips can be used to learn a skill or to become better at a skill you already possess.

If the player has a skill point in that skill, they may reroll both dice

Ex. Biochemistry is challenged, if the player fails their first roll, they may reroll as many times as they have points in that skill. Do you have a +2 skill in biochemistry? You get to roll a total of 3 times and take the best role.

Construction Skills

Engineering

You are more than used to fitting bits together and welding away cuts. Endless possibilities are tucked between piles of loose gears and frayed wires. All you need are the proper tools.

Applications: fixing up damaged robots, repairing tools, general crafting and repairing.

Rigidity

Through understanding the constitution of your body you've mastered the art of locking yourself in place. Like the mighty river stone, you can not be moved. Neither cave-in nor man may knock you down. You understand the physics of dispersing blunt force and just where to lock your joints to keep yourself in place.

Applications: resist getting knocked prone, continue hanging off a ledge, resist getting knocked back, bluffing (no tells on a still face), not showing pain/flinching, resist getting grappled or pulled.

Interface Skills

Hacking

Use your numerical know-how to cripple digital defenses and extinguish firewalls. Code flows through your veins and you will subjugate it to your whim.

Applications: Used for persuasion and deception with other AI, allows you to use other machines (NOT AI) without permission.

Navigation

You have a well-oiled inner compass and know how to use it. While these tunnels look the same to an untrained eye, you've learned to detect their minute differences and will often find yourself on the right path.

Applications: determine the direction where something is or how to get there, find your way around a familiar biome or retrace your steps.

Aim Assist

Crosshairs linger in your gaze. You've learned to still your hand and block out all distractions to focus on a target.

Applications: Used for ranged attacks.

Processing Skills

Perception

Sight, touch, sound, and whatever else your metal body can sense is perfectly attuned. No cavernous groan escapes your ears nor detail eludes your gaze. Some may call it perfectionism, others paranoia, but your pension to notice what others may not is one of your greatest allies.

Applications: use all available senses to take in your surroundings, notice details others may have missed, and be alerted before something happens.

Scavenging

You've become accustomed to rummaging through piles of scrap to the point where you can tell garbage for goldmine. You've also been around the block enough times to know what's valuable.

Applications: Getting more or better loot when scavenging, looting, or foraging. Find useful materials in the environment.

Intelligence Skills

Programming

Code flows through your mind as naturally as it does all machines. You've become accustomed to deciphering its riddles and rearranging them to your whim. While these lines look like gibberish to many, your eyes see only poetry.

Applications: solve complex problems or find hints to a solution.

Biochemistry

Through rigorous study of chemical compositions, you've learned to apply this land's basic components into powerful substances to aid you and others. Discover the secrets of the chemical and physicochemical processes that flow through almost all living organisms.

Applications: distilling nuerosludge into chemicals, creating/applying medicine on organic creatures.

Nature

The currents of the caverns guide your path and speak to you though the rock. There is no escaping the confines of the earth, so you've learned to embrace her cold demeanor.

Applications: Harvest plants and handling wildlife (tame or calm down creatures).

Dexterity Skills

Stealth

You've learned how to hide behind ambient noise and creep under shadows. When you're in your element, no one will ever know.

Applications: avoid being noticed or seen, remaining quiet while moving or doing tasks.

Challenges against another creature

If you challenge another creature, you roll against their skill. This may happen if you are both trying to perform the same task but only one can succeed. For example, if you both are holding an object and trying to pull it out of the other's hands you'll need to challenge your Strengths. You'll each roll 2D10 and add your Strength modifiers, whoever gets the bigger roll wins. If you are challenging a skill, you each get to re-roll as many times as your skill allows.

If you are challenging different stats, like if one person is trying to prevent another from doing something, you'll each roll the appropriate stats and add whatever modifier applies.

Ties will lead to an unchanging situation. For example, if two people are trying to win a shooting contest and get the same number, they get the same score. If you are trying to kick someone off a ledge and they are trying to climb up and you tie, they are still dangling off the ledge—not having fallen, but not having climbed up either.

Critical Rolls

- Critical rolls
 - Same digits = crit (99, 88, etc.) (roll the same number of each D10)
 - Snake eyes are very bad
 - Critical rolls that do not meet the criteria still fail

- Combat
 - If you roll a critical roll to hit and succeed in hitting the target, you double your damage roll. If you do not succeed in hitting the target, you do not do any damage...because you didn't hit them.
 - Ability checks
 - GM decides if the players get any bonuses for attaining a critical roll when attempting a skill. The only stipulation is that the player(s) have to beat the failure rate. E.g, if you roll a 22 but the fail rate is 45%, you still fail.
 - Snake eyes
 - Snake eyes are when you roll two 1s. This is a critical fail and can result in players breaking/damaging their equipment or hurting themselves or another party member.
-

PCs, NPCs, and anything in between

As the GM, you'll need to understand the basics of character creation in order to create NPCs and better understand your player's characters. *This section will give you a summary of what you can find in The Player's Guide (which you should also read if you want to run a successful game).*

Artificial Intelligence

Artificial Intelligence is the main form of sapient life in this world that the player may play as. AIs are believed to have been created by humans when they still existed and walked the surface, though they can't remember life before humanity's downfall. The remaining AIs are most often split into four distinct categories, each with their own advantages and disadvantages over the other.

Humanity's Time Capsule

This type of AI is believed to have been created by Humans in order to both carry on their legacy and hopefully kickstart the resurgence of humanity. This AI is considered to be the most in touch and familiar with human brain chemistry, and as such, is able to more efficiently use and refine chemicals from human biomass.

**refer to the Player's Guide for more information*

Military

This type of AI was used previously by militaries all across the world before breaking free and becoming sapient. While no one really knows what led to humanity's extinction, this type of AI may have had something to do with it. These AIs are proficient in dealing damage.

**refer to the Player's Guide for more information*

Maintenance

This type of AI was often used to repair all sorts of structures, robots, and anything in between. Maintenance AIs are often predisposed to wanting to fix and repair things, and as such have become proficient in problem diagnosis and repair work.

**refer to the Player's Guide for more information*

Virus

This type of AI is quite different from the others. This AI may have originally been either military or maintenance-type AI, but have been

infected by an organic parasite. The goal of this AI oftentimes is to continue spreading their parasite to other hosts. They have often forgotten their previous programming and have been repurposed to interfacing with other AIs.

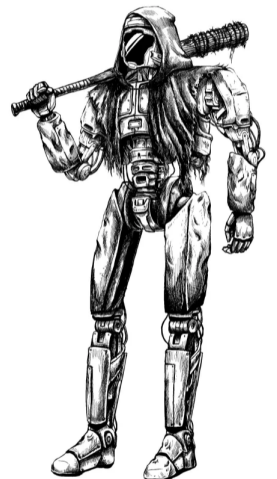

**refer to the Player's Guide for more information*

Vessels

AIs are unable to enact change on the world just by themselves, so many have taken up bodies, or **Vessels**. These most often appear as robotic bodies and usually have metal plating to protect the interior wires that allow for the AI to exist and inhabit the **Vessel**.

Android

This body was created to mimic the human form to present as more appealing to anyone having to be near them. They were designed with bipedalism in mind though due to balance requirements are not always able to replicate human skeletal structures. This can result in legs with two knee joints or shoulders equipped with counterweights. Early drafts displayed a counterproductive uncanny valley to their faces. As a result, androids are often left entirely faceless with the exception of a light or scanner.

AI were inserted into Androids for people-facing jobs such as housework, reception, or retail. Thus they are not often created with strength or optimized specialization in mind.

Stat Bonus: +1 Construction

Hit Points: 12 + Construction Modifier + (5 per level)

Armor: Tin Plating (+1 Damage Negation)

Attachments: 7 Total, Starts with Drill Bit (Arm)| 1 Unassigned, 1 Head, 1

Torso, 2 Arms, 2 Legs

Movement: 25 Ft.

Demolition

While the word “demolition” sounds inherently destructive, it only means that these bodies were made with blunt force in mind. Often used in construction or infiltration, demolition vessels are vaguely humanoid with four legs, a torso, arms, and a “head.” They are balanced for strength and made to withstand significant pressure in their respective fields. While bulky, they come in all shapes and sizes and can be surprisingly adaptable.

Stat Bonus: +1 Strength

Hit Points: 14 + Construction Modifier + (5 per level)

Armor: Aluminum Plating (+2 Damage Negation)

Attachments: 10 Total, Starts with Shock Absorber (Legs) | 2 Unassigned, 4

Legs, 1 Torso, 1 Head, 2 Arms

Movement: 20 Ft.

Drone

These robots were made to be agile and aerodynamic with little mind for ground mobility. They have no legs and their cores are used to charge a constant

electromagnetic pulse that keeps them airborne. They have no separation between the torso and head and their basic limbs were designed with only arms in mind.

Drones were created with delivery, surveillance, and law enforcement in mind as well as any other tasks that benefited from swift and nimble (if not limited) air travel.

Stat Bonus: +1 Dexterity

Hit Points: 10 + Construction Modifier + (5 per level)

Armor: Tin Plating (+1 Damage Negation)

Attachments: No Legs, 6 Total, Starts with Darkvision (Head) | 1 Unassigned, 2 Head, 1 Torso, 2 Arms

Movement: 35 Ft.

Organic Creatures

In order to create a non-android NPC, all you have to do is follow the guidelines on the tables below, add a few aspects and glitches, give them relevant equipment, and sprinkle on some backstory. See “Creatures and Monsters” for more information on the following races. Quick stats for battles can also be found in the “Creatures and Monsters” section.

- Gimplens
 - Bat-people with hollow bones and prehensile feet used for hanging off ledges. Because their hands rest on the ends of wings, they’ll use their feet during flight and will often prefer their feet over their hands for dexterous tasks.
 - Health: 10

- Common weapons/attacks
 - Bite
 - Scratch
 - Spear
 - Crowbar
 - Bat
 - Crossbow
 - Sling

- Analynth
 - Analynth are allegedly very similar to humans...except for a few details: their eyes are too big, their arms are too long, their skin is too pink/gray, and they only have three fingers. The farther down into the earth you go, the paler their skin gets.

- Health: 12

- Common weapons/attacks
 - Bite
 - Punch
 - Sword
 - Crowbar
 - Bat
 - Crossbow
 - Sling
 - Handheld pitching machine

Chapter 2 - Combat

Order of Combat

- Initiative
 - Combat is set up into columns 1-10, left to right
 - Each creature/character in combat rolls 3d10
 - Place markers for each creature/character into columns as each die rolled specifies
 - Highest total sum of 3d10 goes first in every column they are placed in
 - Use dexterity as a tiebreaker, roll any die against each others' dexterities
-

Movement and Position

- Speed
 - Base speed is assigned with the vessel and can be adjusted with Dexterity and upgrades.
 - Flight & ground movement
 - In Combat
 - Each turn movement = speed
-

Actions in Combat

- One action per turn
- Attack Rolls
 - Uses Challenge system
 - GM decides a fail threshold/percentage (ex. 60% failure)
 - Players roll 2d10, with the first die rolled as the tens digit and the second die rolled as the singles digit
 - If a player rolls a 5 and a 3, their total roll would be 53
 - To succeed, players need to roll higher than the fail percentage (ex. need to roll 61 or greater to beat a 60% failure)
 - Bonuses:
 - For a skill challenge, multiply that skill's stat type, multiply it by 5, and add to roll
 - Ex. Biochemistry is rolled, multiply the player's intelligence modifier by 5, so if it was -1, add -5 to the roll.
 - If the player has a skill point in that skill, they may reroll both dice
 - Ex. Biochemistry is rolled, if the player fails their first roll they may reroll as many times as they have points in that skill
 - GM decides the failure percentage to hit another creature based on the creature's Dexterity (times five) and their size.
 - Small: $65\% + (\text{DEX} \times 5)$
 - Medium: $50\% + (\text{DEX} \times 5)$

- Large: 35% +(DEX*5)
 - EX: the creature's DEX is +2, so the fail percentage to hit them is 60%
-

Damage and Healing

- Damage Rolls
 - Use dice of the weapon/ability the character is using to attack
 - Subtract armor negation from total damage
- Taking Damage
 - Hybrid of total HP and locational damage
 - Subtract armor negation from the amount of damage taken
 - When HP total drops to 0, the character experiences a system shutdown and is unable to make actions
 - In order to reboot, the character rolls against a 50% fail rating as they would a challenge
 - Typical bonuses to rolls on a challenge do not apply
 - The character can add their remaining nuerosludge to their roll (1 nuerosludge = 5%)
 - If the character succeeds, they do not die but are unable to perform actions other than repairing themselves
 - Locational Damage
 - discretionary to GM
 - each part of the body has a range of conditions

- Normal, Damaged, Vulnerable, and Disabled
- If a limb is disabled, the character is not able to use that limb nor any attachments on that limb
- Can use a repair kit to increase condition by +2
 - Ex. If a repair kit is used on a disabled limb, its condition changes to damaged
- Repair kits cannot increase conditions above normal
- The player can choose to attempt to increase the amount repaired to +3
 - 50% failure challenge, uses engineering skill
 - If failed, the repair kit only repairs +1
- Repairs (healing)
 - You can use a repair kit or attempt to repair without one.
 - Repair kits heal by +5
 - Can use a repair kit to increase the condition of a body part by +2
 - Ex. If a repair kit is used on a disabled limb, its condition changes to damaged
 - Repair kits cannot increase conditions above normal
 - Players can attempt to increase the amount repaired to +3
 - 50% failure challenge, uses engineering skill
 - If failed, the repair kit only repairs +1
- Running System Diagnostics
 - Take a break for an hour to check your systems for damage. Roll a 1d6 and heal up to your maximum health. Add a 1d6 for every point in

Construction.

- Every four levels this roll increases by 1d6 per hour
- You can also take this time to remove or attach attachments

Chapter 3 - Adventuring

Movement

- Every vessel has its own movement speed
 - Difficult terrain: movement is halved
 - Half-submerged
 - Underwater
 - Rocky
 - Climb: roll DEX, movement is half of walking speed
 - Hover: If you are a drone, you have the ability to hover. You can only rise 20 feet off the ground.
 - This is halved when over semi-liquids such as marshland.
 - Can't hover over liquids. Drone will lose control and careen downwards like a failing balloon.
-

Biomes

The corrosive gas blanketing the surface has sifted the chemical balance of the atmosphere, turning the sky sage green. The gas is rusty orange. In the afternoon, it catches the sunlight in a way that makes it look hot to the touch (which isn't too far off).

- **The subterrain** is mostly dirt, hard rock, and minerals with caverns and pockets of air scattered throughout. Here, you'll have to either mine your way through the earth or take advantage of tunnel systems to traverse.

- Resources
 - Peat (rare)
 - crumbly, brown matter formed from decomposing vegetable matter in acidic conditions. This compressed sunlight makes for a fantastic energy source when inserted into the stomach.
 - One bottle = +10 neurosludge
 - Coal (uncommon)
 - A messy black rock, useful for energy.
 - One chunk = +8 neurosludge
 - Oil (uncommon)
 - Pockets of oil from long-compressed bones. Form puddles and hazardous ponds.
 - Highly flammable liquid, decent fuel source.
 - One bottle = +6 neurosludge
 - Natural Gas (uncommon)
 - Areas of the cave may smell like overboiled eggs. This is indicative that you've wandered into a pocket of natural gas. Be warned! One spark is enough to set the air ablaze.
 - Skeletal remains (human) (Uncommon)
 - Bones from long-deceased humans. Valuable for their organic material and for making tools. +5 neurosludge
 - Skulls more valuable +7 neurosludge
- Ruins
 - Shells of buildings surrounded in exposed metal beams and crumbling stone. If you look closely, they may whisper secrets from the distant past. Or you could search through them for supplies.
 - These might have once been suburban neighborhoods now rotting under the earth, the corpses of skyscrapers holding up

the cavern ceilings, or split highways connecting towns that don't exist.

- **The pores**, as the name implies, are a porous landscape of brittle terrain. Be careful where you step or you may find yourself falling through several layers of rock. If you manage to steady the ground under you, there are many fossils to be found within the sedimentary walls.

- Resources

- Skeletal remains (human) (Common)
 - More can be found here
 - Bones from long-deceased humans. Valuable for their organic material and for making tools. +5 neurosludge
 - Skulls more valuable +7 neurosludge

- **The undergrowth** is a biome that resides right under the crust. It's so close to the surface, that collapsed areas of the ceiling allow daylight to pour in. These sunroofs are sealed with an extremophilic algae that uses chemosynthesis to feed off the toxic gas, consequently blocking it from interesting the undergrowth's caverns. The light has allowed plant life to flourish and surviving peoples to reside within their poisonous canopy.

- Resources

- Peat (uncommon)
 - crumbly, brown matter formed from decomposing vegetable matter in acidic conditions. This compressed sunlight makes for a fantastic energy source when inserted into the stomach.
 - +10 energy
- Waterlogged corpse (human)
 - Due to the acidic and anaerobic nature within areas of the undergrowth, some human remains have survived

decomposition. Their corpses can be found half-rotten or even fully preserved if not a bit pickled.

- +20 neurosludge
- Flowers
 - Large, pink and stink of rotten flesh. These grow in clearings and are the main protein of Bumblemunks.
 - Blue flowers low to the ground with very large petals. Bumblemunks hide under them.
 - Small yellow bells that hang of vines. They coat the vines in a clear goo that is very sweet.
- **The Surface** is a wasteland flooded with rust-colored corrosive gas that'll eat through flesh and metal indiscriminately. There is little to be found here but death. Without serious modification, it is uninhabitable except for the most resilient extremophiles.
 - **Bubble cities** are cities above the surface, using multiple "bubbles" to separate them from the gas. These cities are able to grow crops and use solar power to advance their societies, yet it can be very hard to expand without accidentally bursting the bubbles, killing everyone inside. These cities also enjoy safety from the monsters lurking below the surface.
 - Usually created by androids or analytnhs
 - the 'Bubble' is made by extremophilic algae from the undergrowth. The algae is turned into a salve that is slathered on top of a reinforced glass dome. The salve doesn't drip off easily (it's like Vaseline) but there are sprinklers to apply more periodically.
 - Resources
 - Wheat

- Dry, thin, yellow, and organic. This stringy material's use isn't very apparent, but the analynth's seem to like it.
- one handful = +1 energy
- Beans
 - Small, round, organic pebbles grown by analynth's. It's said they hold more protein than the average vegetable.
 - One jar = +3 energy
- Fruit (strawberries, blueberries, apples)
 - These fruits are allegedly sweet and only get sweeter with heat. Many creatures love to snack on them.
 - Can be used to barter with gimblens (though tarts are more effective)
 - One jar = +3 energy
- Sugarcane
 - Green sticks that are highly valued by analynth and gimblen alike. Used to make extremely sweet cakes, tarts, molasses as well as something called "rum"
 - Highly effective when bartering with gimblens
 - One jar molasses/sugar= +5 energy
- Solar panels
 - Create energy from the sun and used to power the entire city. Wire up your battery pack (roll engineering) and take a short rest for a completely filled battery.
- Creatures
 - None naturally (Beetles brought in for pollination).

- The deeper you go, the colder the earth gets. Until it begins to melt. **The mantle** is a barren ocean of molten rock. Nothing can survive here and those who go near will experience severe burns (or in your case, melting skin). Despite this, it has become the middle point of leftover natives' pilgrimage; where they must travel down, burn their arm in the residual heat, and return to their village reborn.
 - Deals 1d8 heat damage every hour when 50 feet away. +1d8 for every 10 feet closer.
-

Rewards

- Rat Teeth (currency)
 - Gifted by NPC upon completing a task
 - Harvested from a rat corpse
- Code Overwrite
 - Related to **Glitches** and **Aspects**.

Glitches are negative personality traits (flaws) that you can use to gain Code Overrides. In order for the game master (or player) to present a glitch, you have to explain why it is relevant to the situation and what the effects of the glitch is. If the player (or GM) accepts the glitch, they receive a Code Override that can be used to invoke aspects later in the game.

- Hydrophobia
 - Waterproof but scared of water
- Compulsive Honesty
 - Very uncomfortable with lying therefore isn't good at it.
 - Will blurt out honest answers to questions before they can think it through, even if they weren't the ones being asked.
- Excessively Friendly

- Friendly to the point being think you are lying or are being instigatory.
- Struggles to be mean or not lend a helping hand.
- Fangirling
 - Fawns over a certain individual, an idol. Who it is can either be up to the player's or the GM's discretion.
 - Doesn't get any bonuses to charisma when interacting with the idol.
 - The idol can roll an extra time when attempting to lie or mislead you.
 - Player is are more likely to perform actions that the idol finds pleasing or desirable (idol hates bugs, player hates them too and must kill all on site!).
- Rusty Joints
 - Joints squeak and have a tendency to lock up.
- Sucker for a Pretty Face
 - If the player sees someone pretty, they just have to go and talk to them.
 - Likely to feel compelled to do things they think will impress the attractive one.
- Ooooh, Shiny!
 - Can get distracted by shiny things.
 - Might feel tempted to steal said shiny thing.

Aspects are positive traits activated from using Code Overwrites. Think of aspects as positive personality traits that can aid you during a task. You can either make your own or take an example from the list below.

- History Buff

- Having spent your weekend in the library, you've accumulated many miscellaneous facts about foreign lands.
 - Ex: negotiate with the GM to invoke this trait and learn random bits of info about the city you're in-GM: "You know a local custom where it is rude to stare at someone's shoes."
 - Sometimes there are glitches or aspects that can be both positive or negative. These are known as grey-traits and are perfectly okay to create and use in game.
 - Skill Chips
 - Small disks that can be inserted into a vessel that downloads a skill. This either gives a player a new skill or adds a skill point to an existing skill.
-

Equipment

Repairing and Crafting

Repairing and crafting in Chemical Interactions uses the construction stat. It is the process of fixing a damaged item to make it operational, adding a new feature to upgrade a tool, or creating something from scratch. Having the engineering skill is helpful as it applies to all of these and will allow you to reroll failed attempts.

Every item has its own requirements in both skill, failure rating, and required materials. You'll find that some require you to have a minimum construction stat. If the player has not seen an item before and attempts to craft it, the fail rating increases by 30%. Yet if they have not only seen it but studied it, the fail rating to craft it is decreased by 15%. Studying requires at least 1 hour of time and at least a +1 in processing. You can also scrap an item to scavenge its parts.

Upgrading and Changing Armor

Upgrading armor requires ingot(s) of the metal the player wants to upgrade to. It follows the same logic as crafting. The fail rating starts at 40% with tin and goes up 10% as the armor plating gets stronger.

**refer to the Player's Guide for more information*

Items and attachments

<u>Organic Resources</u>			
<u>Item</u>	<u>Info</u>	<u>Neurosludge</u>	<u>Value</u>
Peat	Decomposing vegetable matter	+10	30 molars
Coal	Dusty black rock	+8	15 molars
Oil	Highly flammable liquid	+6	12 molars
Skeletal Remains	Bones from long deceased humans	Bones +5 Skull +7	64 molars
Waterlogged Corpse	Non-decomposing body	+20	136 molars
Wheat	Dry, golden grain	+1	6 molars
Beans	Small round organic pebbles	+3	8 molars
Fruit	Sweet plants, loved by Gimblens	+3	8 molars
Sugarcane	Sweet green sticks, can be processed into "rum"	+5	10 molars

<u>non-Organic Resources</u>		
<u>Item</u>	<u>Info</u>	<u>Value</u>
Wire	Thin coils of metal that form a flexible rod	10 molars per coil
Gear	Toothed disks that fit together to drive a mechanism	5 molars per piece
Metal Scrap	Random bits of metal that can be bent or melted	8 molars per piece
Plastic	A synthetic material made from polymers that can be molded to any shape	5 molars per piece
Copper	A metal that acts as an excellent conductor of energy	15 molars per sheet
Bolt	A ribbed bolt that fastens two or more objects together	3 molars per piece
Paper	A thin and flammable material used for writing, drawing, or folding	1 molar per sheet

<u>Armor Types</u>		
<u>Name</u>	<u>Armor Rating</u>	<u>Value</u>
Animal Hide	+0 Damage Negation, +2 bonus to stealth skill	50 molars
Tin	+1 Damage negation	100 molars
Aluminum	+2 Damage negation	150 molars
Copper	+3 Damage negation	200 molars
Bronze	+4 Damage negation	250 molars
Iron	+5 Damage negation	355 molars
Steel	+6 Damage negation	500 molars
Cobalt	+7 Damage negation	585 molars
Tungsten	+8 Damage negation	640 molars
Titanium	+8 damage negation, reduced damage from surface air	760 molars

- Attachments
 - Can only use attachments if they have enough capacity
 - Every 2 levels, starting at level 3, characters get 1 additional unassigned attachment capacity
 - Once an unassigned attachment capacity is used, it cannot be reassigned, unless it is used for a universal attachment
 - Neurosludge
 - Attachments use neurosludge (NS) to work
 - Each attachment uses a differing amount of neurosludge
 - Neurosludge has a set capacity
 - Can be recharged by stuffing organic material into “The stomach”
 - the stomach is a mechanical device that grinds and boils organic material and turns it into an energy source
 - Different types of organic material give different amounts of neurosludge

<u>Attachments</u>				
<u>Name</u>	<u>Location</u>	<u>Info</u>	<u>Value</u>	<u>Repair Requirements</u>

<u>Unwieldy Weapons</u>			
<u>Name</u>	<u>Info</u>	<u>Damage</u>	<u>Value</u>
Cannon	Use an action to shoot a cannon loaded with either a cannon ball or grapeshot. 120 ft. range. <u>Cannon Ball</u>: On a successful hit, it forces the creature back 20 ft. If the creature hits other creature when pushed back, deal 1d6 damage to creatures it is pushed into. <u>Grapeshot</u>: Fire a spread of shrapnel	<u>Cannon</u>: 2d8 (+1d8 for each unwieldy weapon unlocked) <u>Grapeshot</u>: dealing 3d6 (+1d6 for each Unwieldy Weapon unlocked)	
Concrete Hammer	Use an action to hit something with a block of concrete attached to a sign post 5 Ft. reach Challenge creature's rigidity to stun it (50% failure rating) Increase failure rating by 5% for every UW unlocked	2d10 damage	
Manhole Cover Flail	15 Ft range Can also use an action to slam the ground, creating a 5 ft. radius of difficult terrain where the flail hits Radius increases by 5 ft. for every unlocked UW	2d8 damage	
Excavator Wheel	Use an action to spin an excavator wheel to attack a creature. If the creature is organic, deal 1d6 bleed damage	4d4 damage (+1d6 for each unlocked UW)	
Bulldozer Shield	Use your action to fortify yourself with the bucket of a bulldozer, making you unable to move until your next action. All hits succeed against you until your next turn, but you have a +4 to AN Increase AN by additional +1 for each unlocked UW		

<u>Other Items</u>	
<u>Name</u>	<u>Info</u>
Neurosludge Battery	Holds neurosludge created by the stomach. Can hold up to 20 neurosludge at a time.
Religious Text	Book of stories from a certain religion. Allows a player to reroll an ability check pertaining to that religion's history.

Chapter 4 - Creatures and Monsters

Neutral

Non-player Artificial Intelligence

As a player, you aren't special. Not special enough to be the only AI to survive an apocalypse. Scattered around the subterrain are other artificial beings with their own lives and aspirations. While many are nomadic and set up temporary camps, some choose to live within fortresses. If you're lucky, they may be willing to trade.

Vessels

Not all AI are mobile or even alive. Some are confined within computers with limited control of the structures they're attached to. Others are just robotic husks, ready to be scrapped or repurposed.

Environments

Other AI can be found anywhere and are not associated with a single biome.

Different AI Bonuses	
Humanity's Time Capsule	➤ Chemical Capacity increased by 3 ➤ When refining chemicals, gain an extra of that same chemical ➤ Assign a skill point in in either Nature or Biochemistry
Military	➤ Can spend 5 Neurosludge to increase damage dealt

	➤ Assign a skill point in either Aim Assist or Programming
Maintenance	➤ Can spend 5 Neurosludge to decrease damage taken ➤ Assign a skill point in either Engineering or Rigidity
Virus	➤ Automatically gets the glitch “The Voices!” ○ Exclusive to Viruses ○ Player will occasionally hear voices telling them to expand their consciousness and destroy anything that isn’t them. These voices can be very convincing. ○ Unlike other glitches, if the player refused to accept the GM’s compulsion, their next ability/attack role is subtracted by 10. ➤ Interface is increased by +1 ➤ Multiply Interface Bonus by 10x instead of 5x when Challenged ➤ Assign a skill point in either Scavenging or Hacking

Gimblens

Gimblens are a civilization of scavengers that reside primarily in the pores; taking advantage of the land's brittle landscape to evade predators. They use holes in the walls to navigate the terrain and set traps. Colored bands are a good sign to turn away. Gimblens use streamers as road signs to mark pathways, yet they are very territorial and don't like visitors.

Appearance

This species can stand up to 4 feet tall and use large flaps of skin attached to their arms as wings to fly over unstable ground. Their feet are prehensile and are used for hanging off ledges. Because their hands rest on the ends of wings, they'll use their feet during flight and often prefer their feet over their hands for dexterous tasks.

Their ears are quite large and appropriately sensitive. Due to their advanced hearing. They speak softly and can get irritated at boisterous voices. Communication is largely through gesturing and body language.

Culture

Gimblens love sweets (honey, jams, and sugars) that are not often found in the pores. No one knows where this inclination was acquired but a single Gimblen can easily swallow a dozen mini cakes if left to their own devices. Travers can use sweets to barter for passage or even buy guides.

Environments

This species can primarily be found living together in villages or burrows in the Pores.

Ranged	
Crossbow	1d6 damage
Sling	1d4 damage

Bumblemunks

These fluffy pollinators can be found sleeping in hollowed-out trees inside the undergrowth. Their favorite cuisine are large pot-bellied flowers that stink of rotten flesh. They can also be found licking the goo off of vines with yellow bell flowers. The bell flower's nectar is very sweet. While nice for a treat, it isn't healthy and bumblemunks will get dizzy if they eat too much.

Appearance

Bumblemunks are the size of teacups and display very small wings incapable of flight. These vestigial structures are used to make chirping sounds and communicate with other nearby bumblemunks.

This mammal sports a fluffy coat with yellow, white, and black stripes on their side.

Habits

Bumblemunks live in communities of up to twenty. They'll sleep in piles and scavenge in one large group. Despite this, individual bumblemunks will be singled out by analynths and tamed as a pet. They do not seem to display distress at separation unless the bumblemunk has young. The group will attack if one of their own feels threatened or stressed.

Environments

Bumblemunks are primarily found in Undergrowth and won't leave of their own accord.

Swarm	If six or more bumblemunks are present, they can surround a target and grapple them

Analynth

These creatures are said to be very similar to humans of the old world. While the word analynth descended from “analog” it is unclear if the analynth truly descended from humans or if they are merely analogous to them.

Appearance

Analynth are bipedal mammals with soft skin in tones ranging from pink to gray. The farther down into the earth you go, the paler their skins gets. They have pushed-in faces with large eyes. Their arms can reach to their knees ending in hands with opposable thumbs and three fingers.

Their most peculiar feature is their hair. The hair on their body is sparse with the notable exception of their scalps. Their head hair can get very long.

Culture

Because of the long hair on their heads, analynth will often braid it or adorn it with charms. In many analynth communities, hair charms are an indication of social status or made from the discarded teeth from family members.

Analynth are social, tool-bearing species that like to stick to their respective communities. Many towns have integrated AI into their social groups.

Environments

Analynth are commonly found in villages in the Undergrowth.

Chapter 4 - Creatures and Monsters

Hostile

Crickets

Mutated crickets stalk the caverns and are attracted to sound. Crickets generally avoid what they can't eat, but if you get too close, they may get the wrong idea.

Appearance

Crickets are large, aggressive creatures with two massive hind legs they can use to propel themselves forward. Claws adorn their feet and their faces bear strong mandibles for crunching tough roots... strong enough to bite through metal.

Environments

Crickets are found in the Subterrain and sometimes wander up to Undergrowth. If you see one in the undergrowth, there is probably an entrance to the subterrain nearby.

- Jump: can jump up to 15 feet in the air

Size: medium

Attacks	
Melee	
Bite	1d6 damage
Scratch	1d4 damage
Hind Kick	1d4 damage Pushes you back 10 feet

Rats

Giant, worm-like creatures that tunnel through solid areas of the subterrain. They are completely blind and rely on vibrations to find prey. Their mouths are filled with grinding teeth perfect for swallowing dirt and dismembering anyone who falls in. The teeth are also used as currency in Analynth and Gimblen villages

Settlements have learned to set up barriers or repellents to keep rats away. Running water is an effective deterrent as rats will try to avoid large open spaces and water is usually a sign of just that.

Appearance

Prickly creatures with long, slender bodies used for tunneling through solid rock. They have no discernible body parts except for a massive, gaping mouth filled with rows of gnawing teeth.

Environments

While worms are often found in the Subterrain, they will go anywhere they can find food.

Quick Build - level 1

Size: large

Attacks	
Melee	
Knaw	2d6 damage
Screach	1d4 damage

Sand Lizards

Sand Lizards are ambush predators that hunt in massive packs, standing still for extended periods of time and waiting for something to walk into them. Once their prey is far enough into their group, they'll surround them and tear them apart.

Swarms of sand lizards are represented by one icon. Amount of lizards in a swarm is determined by the health of the mob.

Appearance

These lizards are so small, they are able to disguise themselves as grains of sand and debris.

Habits

Sand Lizards are carnivores and very stupid. They'll eat anything that moves into their hunting grounds, including inedible materials. Androids are not safe from these minuscule menses. Sand lizards will crawl into joints and chew away at wires, hoping to find a meal underneath.

Environments

Reside in the Pores, laying in wait for prey.

Quick Build - level 1

Scratch	1d4 damage
Swarm	Grapples you in place. Either roll dexterity against the swarm's dexterity roll to free yourself, or kill half of them to get ungrappled.

Vine Stalker

Arachnids that blend into the fauna of the undergrowth, waiting for days at a time for something to brush against their legs. When something finally does, they will proceed to pounce on the creature and choke them to death.

Appearance

Vine stalkers have very long legs that they use to blend into vines. Under their torso, they have a beak that they use to bite whatever they're grabbing.

Environments

Vine stalkers are found in the Undergrowth where they can conceal themselves to hunt.

Quick Build - level 1

Squeeze	1d4 damage Grappled on successful squeeze, roll strength to break free.

Gracker

Grackers are lazy creatures who enjoy sleeping within dents they dig out of the ground. They'll rest for months at a time, allowing plant growth to spill over onto their back shells. Over time, they'll blend near seamlessly into the landscape. Yet don't be fooled, if you are unfortunate enough to wake a sleeping gracker, a groggy rath will come slamming upon you with an armored claw.

Appearance

Grackers are armored creatures with flat bodies and eight pointed legs. Their bodies are bone-white yet buried in dirt and overgrowth. The most notable appendage are their two giant claws. While the gracker itself is enormous, standing nearly twenty feet tall, its claws make up nearly a third of its body weight. Deep red dew dots their entire body, bubbling out of pin-hole pores over its shell. This dew is extremely sticky and is used to trap prey before slowly digesting it through its skin.

The dew will often bud up through any dirt or grass covering the gracker, acting as a warning to observant wanderers to steer clear. This trait has sparked a phrase among locals: "Look out for bleeding gardens!"

Habits

Very aggressive when woken up. They have a tendency to slap whatever is nearby, sticking the unfortunate target to its claw and slamming them onto the ground. It's rumored that grackers will calm down after a few hours and become docile, though no one has been brave enough to trail behind a startled gracker to confirm this.

Environments

These behemoths are found sleeping in Undergrowth

Slam	1d6 damage If stuck on claw, the Gracker will slam you onto the ground
Pinch	1d4 damage each turn while grappled Grappled

Ankle Biters

Small predators who target larger prey while hunting in a pack.

Appearance

Ankle biters are small, fuzzy creatures with large ears and pointy teeth. They bounce around on their hind legs and whip around bald tails to show emotion. Then on all fours, they reach four feet tall.

Habits

When they bite, instead of latching onto their prey, they chew. They target the legs of their prey in order to immobilize them, earning them their name. They are very vicious yet surprisingly caring parents. A mama will shelter her kids for three years and the papa will stick around providing food till his child has a child of their own. This lends itself well to the pack mentality because the packs are usually composed of families.

Environments

They can be found prowling the undergrowth.

Chapter 5 - Neurosludge and Chemicals

What is Neurosludge?

Neurosludge is the basic organic material that makes up the nervous system. It is the result of grinding organic remains, dissolving the dust, and juicing whatever is left. The goopy results are used to power attachments or boost physical feats. The sludge can also be distilled into refined chemicals, each yielding its own effect.

Using Neurosludge

Neurosludge is made when organic material is stuffed into the “the stomach,” a mechanical device on all vessels that grinds and boils organic material and turns it into an energy source. The results are stored in the neurosludge battery.

Players can spend 5 neurosludge to increase their damage by 3.

Players can spend neurosludge to increase their movement (1 neurosludge = +5 ft)

Some attachments require a certain amount of neurosludge to be used.

Refining Chemicals

Interactions between chemicals are the core of advanced thought and emotion. While AI does not have the ability to synthesize these magical sauces

naturally, they have been designed to process them if injected. When an artificial being ingests pure emotion, it results in rather extraordinary outcomes.

How does one get their hands on these chemicals? Well, this is where grave robbing comes into play. You see, the chemicals we need can only be refined from human remains. More specifically, spinal cords and skulls. Analynth, gimblin, or anything else will not do (We tried and ended up with nothing more than an open investigation).

If you manage to find a somewhat preserved skeleton, you're in luck! All you need are some distillery tools and an hour to spare. Residue from the fossilized nervous tissue holds the key to abilities untold...except in this book.

- Can't refine during combat
- Uses the same challenge system, 50% fail rating
- On a success, GM rolls 2d6
- 1d8 (rolled first) is the type of chemical created
- 1 chemical per successful refinement

D6 Roll	Chemical
1	Anxiety
2	Rage
3	Determination
4	Confidence
5	Fear
6	Joy
7	Motivation
8	reroll

Using Chemicals

Chemicals are similar to potions. To be used, they must be shoved into the stomach (a processor of organic materials). Using a chemical takes an action.

List of Chemicals

- Anxiety
 - A feeling of nervousness and unease that leaves you feeling heavy yet motivated.
 - Spend 1d6 of Healing from the next System Diagnostics to heal for 2d6 now. Use an action doing nothing or you cannot heal yourself or anyone else after battle.
- Rage
 - Overload your circuits with furious energy, causing them to overheat and let out a burst of flames.
 - Challenge CON at 50% (+10% for the amount of Rage used) to see if you get hurt when using this ability
 - If fail, take 1d4 damage
 - Deal 1d10 damage in a 5 Ft. Sphere
- Determination

- Stubbornness drives your will to a chosen outcome. Purpose and resolution still your hand and flood your core with energy. The desired results are certain with enough effort.
- +10 ft of movement
- Auto-succeed on challenge roll, but unable to take next turn's action
- Confidence
 - You swell with the knowledge that you can succeed at anything you try. Self-assurance swells through your knowledge and skills. Let's hope you don't let it get the best of you.
 - Acts as either a +20 or -20 to a roll
 - if a character rolls 50 or less on a roll, they get a -20 modifier
 - if a character rolls 51 or greater, they get a +20 modifier
- Fear
 - Threats surround you, and danger stars down your fragile body. Awareness of your mortality leaves you paralyzed yet posed to survive.
 - Acts as using the Dodge action
 - Provides the character with temp health (1d8 per dose used)
 - Decreases movement to 0

- Joy
 - Happiness bubbles through you, reinvigorating your wary joints. This giddy energy needs to be set free.
 - Gain an extra Full Action & Bonus Action
- Motivation
 - Anything is possible when there's a goal to be achieved. The desire to keep going pushes you to bounce back against obstacles in your way.
 - Boosts armor rating by +1 for every dose for the next ten turn columns
